

Judges' walkthrough nine screens, about five minutes.

Every screen below names the BrightPath problem it answers, tells you exactly what to click, and points out what is worth looking at once you are there — including the places where the system deliberately refuses to answer.

Before you start

Two things worth knowing, and then you can go straight through.

SIGN-IN

Judges@buildfest.com

Already filled in for you — just press "Sign in". No password is checked and no account is created. This is a presentation gate so a visitor meets the marketing site first, not authentication; the source file says exactly that. The real boundary is the API bearer token and per-tenant scoping on every database query.

If the first page is slow, that is the database waking up. Neon's free tier suspends the compute when idle, so the first request after a quiet period can take a few seconds. One refresh and everything after it is instant. It is worth loading [/dashboard](#) once before you start timing anything.

The route

Follow it in order. Steps 1 and 2 are the public front door; 3 to 8 are the product.

1	2	3	4	5	6	7	8
The website /landing	Send an enquiry #contact	Sign in /sign-in	Pipeline /dashboard	Leads /leads	Capture /leads/new	Lead record /leads/{id}	Inbox & API /mail

The four problems to keep in mind

Each screen is tagged with the one it addresses, so you can check the build against the case study rather than against a feature list.

- **Problem 1 — nobody answers fast enough.** Every lead is somebody's job and no lead is anybody's deadline, so the ones that go cold do so quietly.
- **Problem 2 — good leads look like all the rest.** A funded buyer with a deadline arrives in the same inbox, in the same font, as a price-list enquiry.
- **Problem 3 — reps re-read raw enquiries by hand.** Pulling company size, industry, budget, need and intent out of prose is slow, repetitive, and done differently by everyone who does it.
- **Problem 4 — every follow-up is written from scratch.** It is the task that gets postponed, usually on exactly the leads that matter most.

1 The website

brightpath-dashboard.vercel.app/landing

THE PROBLEM THIS ANSWERS — PROBLEM 1

The website is one of five channels the case study lists. Start here because it is the one a judge can actually use: what you type becomes a real lead in the same pipeline as everything else.

WHAT TO DO

1. Open the live application. You land on the marketing site, not the product.
2. Click **Contact** in the top navigation, or scroll to the bottom of the page.

WHAT TO LOOK FOR

- Nothing here is placeholder copy — the whole site was rewritten for BrightPath, and the product is entered on purpose from **Sign In**.

2 Send a real enquiry

brightpath-dashboard.vercel.app/landing#contact

THE PROBLEM THIS ANSWERS — PROBLEM 3, AT THE SOURCE

The form asks for **no headcount band and no budget bracket**. Solving intake by refusing the input would be cheating — the analyst's job is to cope with whatever someone felt like typing.

WHAT TO DO

1. Describe a problem in the large box — mention a budget and a deadline if you want to see the scoring bite — or press **Use a sample enquiry**.
2. Submit, then carry on and go and find what arrived.

WHAT TO LOOK FOR

- What you type is **stored, analysed, scored, drafted against and given a next action** before anyone opens the record.
- This form is hidden once you are signed in, so use it before step 3 or in a private window.

The marketing site. The product sits behind it.

The enquiry form. It replaced a template contact form that logged to the console and reset itself.

3 Sign in

brightpath-dashboard.vercel.app/sign-in

WHAT TO DO, AND WHAT IT IS

- Press **Sign in**. The demo account is already filled in, and the session lasts thirty days.
- **Nothing here is checked** — no password, no user record, no account created. The page says so under the button rather than implying otherwise.
- The real boundary is elsewhere: a bearer token on every API call and tenant scoping on every query, proven by four cross-tenant checks.

Honest about being a gate rather than dressed up as security.

4

The sales pipeline

brightpath-dashboard.vercel.app/dashboard

THE PROBLEM THIS ANSWERS — PROBLEM 1

Slow response is invisible on most dashboards, because a lead nobody has answered looks exactly like a lead that is progressing. This page makes the gap countable.

WHAT TO DO

1. Read the four tiles left to right.
2. Click **SLA breached** — it is a live filter, and it takes you to exactly those leads.
3. Read the response-time panel, then the two breakdowns below.

WHAT TO LOOK FOR

- **"Awaiting first touch"** and **"SLA breached"** are the case study's failure, on the front page, with numbers.
- **"Needs human review"** counts leads the system refused to score — withheld, not guessed.
- **"By sales status" is labelled human-set.** The assistant never moves a lead through it.

Every figure here is read from the database. The template's demo revenue chart and sample task table were deleted rather than restyled — a chart of invented conversions is exactly the claim the brief warns against.

5

Leads — the triage queue

`brightpath-dashboard.vercel.app/leads`

THE PROBLEM THIS ANSWERS — PROBLEM 2

High-potential prospects miss timely follow-up because nothing distinguishes them on arrival. This is the screen a representative would actually work from: every lead with its score, its priority, its follow-up state and how long it has been waiting.

WHAT TO DO

1. Filter by **priority**, **qualification**, **status** or **SLA state** using the controls above the table.
2. Look at the address bar as you do it — the filters are written into the URL.
3. Sort by first-touch deadline to see what a rep should pick up next.
4. Click any row to open the full record; that is step 7.

WHAT TO LOOK FOR

- A filtered URL such as `/leads?priority=HIGH` is validated by **the same schema the API route uses**, so the page and `GET /api/v1/leads?priority=HIGH` cannot disagree with each other.
- Leads whose evidence was too thin show a **score of "—"**, **never 0**. Zero is a judgement; the absence of one is a different thing and must not share a glyph with it.
- A broken or hand-edited filter falls back to the unfiltered list rather than throwing an error page.

Leads + Capture lead

Captured, qualified and scored against BrightPath's rubric. The assistant proposes; you decide.

Leads in pipeline: 15
10 marked high priority
Every lead captured for this tenant.

Awaiting first touch: 8
Nobody has responded to these...
The gap the assistant exists to close.

SLA breached: 9
Past the first-touch deadline
Exactly the failure in the case study.

Needs human review: 2
Evidence too thin to score
Withheld rather than guessed.

Search company, contact or need

Priority: any Qualification: any Status: any SLA: any

The triage queue. Same four pipeline tiles at the top, then every lead with its score, priority, qualification, follow-up state and SLA clock.

6

Capture a lead

brightpath-dashboard.vercel.app/leads/new

THE PROBLEM THIS ANSWERS — PROBLEMS 3 AND 4

This is where the reading and the writing stop being a person's job. Paste an enquiry however it arrived — a website form, a referral email, notes from a call — and the assistant extracts the evidence, scores it, drafts a reply and recommends a next action before anyone opens the record.

WHAT TO DO

1. Press **Use a sample enquiry**, or paste your own text into **"Enquiry, email body or call notes"**.
2. Add an email address under Contact if you want the follow-up to have somewhere to go.
3. Leave **"Run the assistant on arrival"** ticked.
4. Press **Capture lead**. You land on the finished record.

WHAT TO LOOK FOR

- **"What you already know" is entirely optional**, and the help text warns that a guess typed here becomes evidence the score is built on. Blank fields stay blank; nothing is inferred to fill a gap.
- The raw text is kept unedited alongside the normalised fields, so extraction can be re-run and checked against the source.

Leave **"Email this contact and the team inbox"** switched off unless you mean it. It sends a real acknowledgement to the address you typed and a real alert to the connected mailbox — the same two messages a website enquiry triggers. These go to a real person.

The screenshot shows the 'Capture a lead' form in the Brightpath Solutions Admin Dashboard. The dashboard has a dark theme. On the left is a sidebar with navigation links: Sales assistant, Pipeline, Leads, Capture lead (active), Workspace, Inbox, Tasks, Calendar, and Team. A 'Welcome to Brightpath' notification is also visible. The main content area has a search bar and navigation links (Home, Pricing, Contact). The 'Capture a lead' section includes a 'Back to leads' link, a description of the form's purpose, and two main input sections: 'What arrived' and 'Enquiry, email body or call notes'. The 'What arrived' section has a text area for pasting the enquiry and a 'Use a sample enquiry' button. The 'Enquiry, email body or call notes' section has a larger text area for pasting the lead's own words. Below these is the 'Contact' section, which includes fields for Name, Email, Phone, and Role, along with a 'Test' button. The 'Contact' section also has a note: 'At least one way to reach them. Blank fields stay blank — nothing here is inferred.'

The capture form. The paste box comes first because the lead's own wording is worth more than a tidied summary.

7 The lead record — how the score was reached

brightpath-dashboard.vercel.app/leads/{id}

THE PROBLEM THIS ANSWERS — PROBLEM 2, AND THE TRUST PROBLEM UNDERNEATH IT

A score nobody can explain is a score nobody will act on. This page is laid out in the order the judging journey reads: what arrived, what the assistant found, what it scored and why, what it wrote, what it recommends — and then, in its own column, what the human decided.

WHAT TO DO

1. Read the score, then read **"How the score was reached"** underneath it.
2. Note the rubric name and version printed next to the score.
3. Press **Re-run: score** and watch the number land in exactly the same place.

WHAT TO LOOK FOR

- **Every point traces to a named rubric line** with its own points out of a maximum — company fit, industry fit, need, budget, interest.
- The example scores **2 out of 15 on industry fit and 5 out of 20 on budget**. The assistant is not flattering the lead it happens to be reading.
- **Evidence coverage** shows how much of the score rests on real quotes. Low coverage lowers confidence rather than being filled in.
- Re-running gives the same answer because the model never computes the score — deterministic code does.

10Alytics 72

Alexander Lawal · Internal Judge · Medical

HighQualifiedWonResponded in timeSent

Run the assistantRe-run: extract evidenceRe-run: scoreRe-run: draft follow-upRe-run: recommend action

Score 72/100 HighQualified

Cleers the rubric threshold and is worth a rep's time. Scored 25 Aug 2026, 14:58 UTC against rubric brightpath-bant-1.0.0.

Evidence coverage 92%

The share of qualification signals backed by a real quote from the lead. Low coverage lowers confidence rather than being filled in.

How the score was reached

Company fit20 / 20 pts

50-249 employees — squarely in BrightPath's SMB range.

Industry fit2 / 15 pts

"Medical" classified as outside — outside the sectors BrightPath serves.

Need25 / 25 pts

Stated a specific problem and a reason it is urgent.

Budget5 / 20 pts

Stated budget of about \$2,174/yr — under \$5k/yr.

Interest20 / 20 pts

Asked to speak to someone or requested a next step.

Sales disposition Won

Yours, not the assistant's. Nothing in the pipeline can move a lead's status or reassign it.

Status Won

Owner Unassigned Save

An unassigned high-priority lead is the one that goes cold. This is the field that stops that being invisible.

Lead record

Page 6

The lead record — the evidence behind the score

Scroll down on the same page. This is the panel worth the most of your time.

THE PROBLEM THIS ANSWERS — PROBLEM 3

This is the reading a representative would otherwise do by hand, done once and shown with its working. Each signal names what was found, how confident the extraction was, and the lead's own words that produced it.

WHAT TO DO

1. Read each signal and compare the quote against **"What arrived, verbatim"** in the right-hand column.
2. Read **"Other context"** at the bottom of the panel.
3. Press **Re-run: extract evidence** if you want to watch it happen live.

WHAT TO LOOK FOR

- **Every claim carries the verbatim quote it came from.** A claim whose quote cannot be found in the source text is dropped before it ever reaches the score.
- A signal with no quote is **reported absent, not guessed.**
- "Other context" surfaces a **contradiction the system noticed but refused to resolve** — the structured industry field says one thing, the message says another — and flags a currency conversion as an estimate to confirm.

Evidence with its sources. The model that produced each extraction is named, and so is the confidence it reported.

The lead record — what it wrote and what it recommends

Keep scrolling. This is Problem 4 answered, and the honesty rule that governs it.

WHAT TO DO

1. Read the drafted subject and message, then the **"Personalised using"** tags beneath it.
2. Read **Next action** and the sentence explaining why that action and not another.
3. Look at the **Timeline** in the right-hand column and read the actor tag on each entry.
4. Change the **Status** dropdown and watch a new timeline entry appear, attributed to **rep**.

WHAT TO LOOK FOR

- The draft **names which extracted signals it drew on**, so every personal detail in it traces back to something the lead actually said.
- **Exactly one next action** is recommended, with a reason — not a menu of five options that leaves the decision where it was.
- The timeline distinguishes **rep**, **system**, **ai:analyst** and **ai:writer**, so who did what is never in doubt.

There is no button anywhere that simply marks a follow-up as sent. "Send now" performs a real SMTP send and records the message id the mail server returns. "Record a send" is for a rep who sent from their own client and pastes that client's message id in. A button that just flipped a column to **sent** would be the most damaging lie this application could tell, given that it exists because leads go cold unnoticed.

Draft, provenance, send controls and the recommended action. The timeline on the right is append-only.

8

The inbox

`brightpath-dashboard.vercel.app/mail`

WHAT TO DO

1. Open **Inbox** from the sidebar and read an enquiry as it was delivered.

WHAT TO LOOK FOR

- These are **rows in the database**, not the template's hard-coded sample array. An inbox that is a build artefact is not an inbox.
- The header names the address enquiries are actually delivered to when a mailbox is connected.

The inbox, rebuilt on real enquiries.

A two-minute proof, if you want one

Open `brightpath-dashboard.vercel.app/api/v1/health` in a browser tab. It answers one of three ways, and the difference matters: **ok** — database reachable and an AI provider configured; **degraded** — a 200, database fine, but no AI key, so seeded leads still read correctly while newly captured ones come back **NEEDS_REVIEW** with no draft; **unhealthy** — a 503, the database is unreachable and nothing will work. It reports degradation rather than pretending to be fine.

Every request also returns an `x-request-id` header and writes one structured log line, so any specific failure you hit can be found again by id.

What this build is not claiming

- **Authentication is one shared token, not user accounts.** Tenant scoping is real and enforced on every query; individual logins do not exist.
- **Rate-limit counters are per-instance.** Serverless functions do not share memory and a cold start forgets the count.
- **Webhooks verify no signature.** Any caller can post a lead to a source endpoint.
- **Mail is send-only.** The system delivers and records a receipt; it does not read a mailbox, so a lead's reply cannot arrive back automatically.
- **Tasks, Calendar, Team, Pricing and FAQs are interface-template scaffolding.** They still show sample content, they are left in as chrome, and they are not part of this submission. Everything under **Sales assistant** and **Inbox** in the sidebar is.
